

1. Purpose

To explain some possible causes for why TD SYNEX would be unable to open a support case.

Note: In the CSP program resellers and end user customers are not able to open support tickets with Microsoft. The CSP Direct/Indirect partner must open support tickets from the Azure portal.

The information provided is based on Microsoft policies. TD SYNEX has no control over the limitations on the creation of support tickets.

3. Reference

3.1. Subscription is Not CSP

TD SYNEX is only able to open Microsoft support cases for subscriptions that are billed through TD SYNEX. This means that the subscription must be a CSP subscription.

An end user customer may purchase many types of subscriptions including Enterprise Agreements (EA) and Pay-As-You-Go (PayGo) as well as many free subscriptions such as Trials and Sponsorship subscriptions. All these subscriptions will appear in the end user's tenant.

Even if access to the subscription is given to TD SYNEX, we would still not be able to open support cases for any subscription not purchased through TD SYNEX.

3.2. Subscription Not Billed by TD SYNEX

The end user customer may have CSP subscriptions from TD SYNEX and other direct / indirect providers simultaneously. The provider is only able to open support cases for the subscriptions billed through that provider.

We are often asked to open support cases when issues arise during a transfer to TD SYNEX. Until the subscription has successfully transferred to TD SYNEX, we are unable to open a support case. The current provider would need to open a case.

3.3. No Azure RBAC Permissions to the Subscription

Assuming, the Azure subscription is billed through TD SYNEX...

To open a support case for an Azure subscription, TD SYNEX's foreign principal requires an RBAC role that includes at least Support Request Contributor. There is a specific role called Support Request Contributor, but it is also included in the Owner and Contributor roles.

This role allows the user to create support requests; however, in CSP it only works for the provider's foreign principal. Assigning this role to a user does not allow them to open support cases.

See: "Tech Note - Add AOBO to Subscription for TDS" for instructions on how to add TD SYNEX's foreign principal.

3.4. No GDAP Permissions to the Tenant

3.4.1. Azure

Assuming, the Azure subscription is billed through TD SYNEX...

If a GDAP relationship was requested, the relationship must be completed before an Azure support case can be opened. This means that the end user must be accepted by the end user and completed in TD SYNEX's Partner Center before the TD SYNEX technician can login and open a case.

If a GDAP relationship was never requested (uncommon), it may be possible to open a support case for Azure but there may be other limitations.

The reseller's TD SYNEX account manager can assist with the creation of a GDAP relationship.

3.4.2. Modern Workplace

Assuming, the Modern Workplace license is billed through TD SYNEX...

A GDAP relationship with at least the Service Support Administrator Entra ID role is required to open a support case.

The reseller's TD SYNEX account manager can assist with the creation of a GDAP relationship.

3.5. Conditional Access Block

The end user may implement Conditional Access policies that may block TD SYNEX's access to the end user tenant. Since support cases must be opened from the end user's tenant this would block our ability to open cases.

The end user would need to exclude TD SYNEX from the conditional access policies to allow our technicians to log in and open cases.

See: "Tech Note - Exclude TD SYNEX from Conditional Access" for instructions on how to exclude TD SYNEX from conditional access policies.

4. Definitions

Term	Definition
RBAC	Azure RBAC (Role-Based Access Control) is an authorization system that provides fine-grained access management of Azure resources, allowing you to manage who has access to Azure resources, what they can do with those resources, and what areas they may access.
Foreign principal	An Azure indirect reseller's foreign principal is a set of permissions that allows the reseller to manage a customer's Azure services and resources, inheriting owner permissions on the Azure subscription.
