

1. Overview

The Microsoft Cloud Solution Provider (CSP) program is a group of more than 90,000 partner companies. It is Microsoft's primary partner sales motion for small and midsize businesses and for smaller corporate customers within the new commerce experience.

CSP partners create and deliver differentiated offers to customers, selling the Microsoft cloud portfolio and third-party solutions from the Microsoft commercial marketplace alongside their own value-added solutions and services. They are enabled to manage the entire customer engagement lifecycle and be their customers' trusted advisors.

The CSP program is not intended to be a "discount program" for the Pay-As-You-Go pricing model, which is priced at MSRP. The intent is for the indirect reseller and indirect provider (TD SYNEX) to deliver a level of support to the end user that Microsoft cannot provide in the direct model.

The CSP partners must provide several services for the end user customer. The most obvious is that the provider must open support tickets with Microsoft when required and must provision services when they are purchased. To complete these tasks, the provider needs some level of access to the end user tenant.

2. Purpose

The purpose of this document is to discuss the different types of access, why TD SYNEX and resellers need access, how concerns may be mitigated, and the effects of removing access to the tenant.

The tools and processes used to access end user tenants are provided by Microsoft. TD SYNEX must work within the framework provided by Microsoft.

IMPORTANT: It is the end user's right to, and TD SYNEX fully supports, restricting TD SYNEX's access to their tenant and subscriptions; however, the end user needs to understand the effects of restricting access.

4. Reference

4.1. Cloud Solution Provider (CSP) Participants

There are four parties involved in the CSP program:

Microsoft

Microsoft owns the resources provided through the program. They are ultimately responsible for the resources, their availability, and supporting the resources. Microsoft will always have administrative access to the end user tenant.

Indirect/Direct Provider

The indirect/direct provider has a direct billing relationship with Microsoft. The provider receives an invoice from Microsoft.

An indirect provider sells to end user customers through indirect resellers. Direct providers can sell directly to end user customers.

The provider is the only party that can directly interact with Microsoft regarding billing and support.

End user customers are often unaware of the indirect provider and their role.

TD SYNEX is an indirect provider.

Indirect Reseller

The indirect reseller purchases from an indirect provider and resells the services to the end user. The indirect reseller is responsible for the relationship with end user and is responsible for invoicing the end user for the services purchased.

There is no indirect reseller when there is a Direct Provider since the direct provider sells directly to end users.

End User

The consumer of the Microsoft services.

The end user owns the Azure Entra ID tenant and has the sole right to determine who may have permissions to access the tenant and which permissions they may have.

The end user may remove permissions at anytime using the tools provided by Microsoft.

4.2. Reseller Relationships

4.2.1. Purpose and Use

A reseller relationship is established between the provider and end user to allow the provider to sell Microsoft cloud services to the end user. This relationship is established by a global administrator in the end user tenant accepting a request from the provider. The request is a URL provided to the end user.

A reseller may also request a reseller relationship with the end user to allow the reseller to manage the relationship with the end user. This relationship does not allow the reseller to sell Microsoft cloud services to the end user.

A reseller relationship only allows the reseller and provider to sell services to the end user. It does not grant any administrative rights to the end user tenant; however, the provider is able to see a list of resources provisioned in the subscriptions and to obtain costs related to the resources.

A reseller relationship may only be terminated by the provider or reseller after all resources billed through the relationship have been transferred or terminated.

4.2.2. Relationship Links

The reseller relationship link may create a relationship with one party or both parties at the same time. Sometimes the end user will be asked to accept separate links for each party. Either way, the result is a reseller relationship.

The following example link would create a reseller relationship between TD SYNEX and the end user. The reseller could provide a similar link so they could manage the end user in their Partner Center.

<https://admin.microsoft.com/Adminportal/Home?invType=ResellerRelationship&partnerId=ff1b2576-d461-4916-97dc-7ada1cd798dc&msspId=0#/partners/invitation>

A link structured as follows would create a relationship between the reseller, TD SYNEX, and the end user.

<https://admin.microsoft.com/Adminportal/Home?invType=IndirectResellerRelationship&partnerId=000f8887-cff3-4642-b795-000aaabbb222&msspId=12345&indirectCSPId=ff1b2576-d461-4916-97dc-7ada1cd798dc#/partners/invitation>

In older versions of these links, there was a parameter DAP= true or false. This is related to providing DAP permissions at the same time. This feature was removed in CY2023 when DAP was deprecated and will no longer function – new links would be required. GDAP permissions will be requested with a separate link.

4.3. Delegated Administration Permissions (DAP)

Delegated Administration Permissions, sometimes referred to as DAP, refers to permissions provided to the indirect provider and/or reseller in the end user's Azure Entra ID.

The DAP model only provided for the global administrator role in the end user tenant, and it provided this role to every individual in the provider's or reseller's AdminAgents security group.

The DAP model has been deprecated and has been replaced by GDAP. No new DAP relationships can be created.

Microsoft began the process of transitioning DAP relationships to GDAP on May 22, 2023. They paused it for the month of June then started again in July. The process is expected to be done by the end of CY2023.

During the transition, Microsoft will do one of the following:

- If there is no **active** GDAP relationship, Microsoft will add a GDAP relationship with a [pre-defined set of permissions](#) and assign those permissions to [existing Admin Agents and Help Desk Agents groups](#) in the provider's tenant. Microsoft then removes the DAP relationship.
- If there is an existing **active** GDAP relationship, Microsoft removes the DAP relationship.

This work is done behind the scenes and no notification is provided.

4.4. Granular Delegated Administration Permissions (GDAP)

The Granular DAP (GDAP) model allows for specific [Azure AD roles](#) to be given by the end user and it allows the provider/reseller to assign the roles to users who need specific roles. For example, the end user may give the global administrator and service support administrator roles. The provider may then give the global administrator role to some users and others may only get service support administrator.

Note that the provider and reseller do not need any Azure AD roles to sell services to the end user. All roles may be removed.

Removing permissions will affect the support that the provider is able to provide to the end user. Two examples include 1) the provider will not be able to open Modern Workplace (MWP) support cases; and, 2) permission to access new subscriptions cannot be given to the end user staff. There are other effects depending on the services purchased.

The minimum permissions TD SYNEX recommends are Service Support Administrator and Directory readers. These roles will allow TD SYNEX to complete the tasks in the example above. They are included in our "GDAP Limited" request.

GDAP relationships are started in TD SYNEX's ecommerce portals.

Should no permission be provided on an ongoing basis, reestablishing them can take 24 to 48 hours thus delaying support should it be required. Additionally, should the end user get locked out of the tenant, it could take weeks or months to regain access.

4.4.1. GDAP Roles Requested

GDAP requests from TD SYNEX are made from the Stellr or ION eCommerce platforms. The reseller has the ability to choose either GDAP Limited Access or GDAP Recommended Access.

GDAP Limited Access includes the following Entra ID roles:

[Service Support Administrator](#), [Global Reader](#) and [Cloud Application Administrator](#)

GDAP Recommended Access includes the following Entra ID roles:

[Service Support Administrator](#), [Global Reader](#), [Cloud Application Administrator](#), [Help Desk Administrator](#), [Privileged Authentication Administrator](#), [Billing Administrator](#), [License Administrator](#), [User Administrator](#), [Intune Administrator](#), [Security Administrator](#), [Password Administrator](#), and [Directory Reader](#)

The GDAP Limited Access allows TD SYNEX to open Modern Workplace support tickets for the customer (Service Support Administrator), enumerate most object in Entra ID (Global Reader), and manage enterprise applications (Cloud Application Administrator) which is needed for our eCommerce platforms to function correctly.

Our platforms require Cloud Application Administrator to refresh application consent when we publish our platform to the customer directory. Publishing our applications is not done once. Removing Cloud Application Administrator may block the ability for the reseller to interact with our platforms and will block our security posture management and Insights dashboard.

The GDAP Recommended Access included the roles in GDAP Limited Access but also includes roles that allow TD SYNEX to support the end user as needed.

4.4.2. TD SYNEX Relationship Naming

TD SYNEX has adopted a standard naming convention for relationships created by us. GDAP relationships created by TD SYNEX generally begin with a prefix, followed by the tenant ID, then a date serial number. This allows for all relationship names to be unique as required by Partner Center.

Prefix	Description
DMT- or GBM-	Created by TD SYNEX using the bulk migration tool
GDAP- or GDAPS-	Created by the Stellr platform
GDAP-M, GDAP-L, or GDAP-H	Created by the ION platform
<tenant_id>-<epoch_datetime>	Created by the SCM platform

Microsoft may create relationships for the partner using the following prefixes:

Prefix	Description
MLT-	Created by Microsoft during the Microsoft Led Transition from DAP to GDAP
Default_	Created by Microsoft using default permissions when a new tenant is created.

4.4.3. GDAP Auto Extend

Microsoft GDAP auto extend is a Partner Center feature that automatically renews an active Granular Delegated Admin Privileges relationship for an additional six months when the expiration date is reached. The relationship continues without interruption, without requiring new customer consent or reassignment of Entra roles, and the renewal repeats every six months as long as auto extend remains enabled.

GDAP relationships that include the Microsoft Entra Global Administrator role stay ineligible for auto extend.

TD SYNnex systems automatically enable GDAP auto extend.

4.5. Administration on Behalf Of (AOBO)

[Administration on Behalf Of](#) (AOBO), sometimes referred to as foreign principal, is related to access to an Azure subscription. AOBO allows members of the provider's/reseller's AdminAgents security group to access Azure subscriptions with the roles assigned.

AOBO is automatically provided to the provider when a new subscription is created. If removed or if a subscription is transferred from another provider, then AOBO must be added using a PowerShell script.

Note that the provider and reseller do not need any RBAC roles to sell services to the end user.

In the CSP program the indirect reseller gets a discount for supporting the end user customer. This discount is in the form of a credit called [Partner Earned Credit](#) (PEC). Microsoft confirms that the reseller is eligible for the credit by checking for a minimum level of access provided to the provider. If this access is removed, then the cost for the services billed to the reseller will increase to slightly more than MSRP until 24 hours after access is restored.

The reseller should discuss the TD SYNnex access with the end user and explain the ramifications of removing access. Microsoft will not provide credits for lost PEC.

Although the permissions affect many areas the most obvious effects are:

1. No support tickets for Azure issues can be raised;
2. Azure Reserved Instances and Savings Plans cannot be purchased; and,
3. Access to subscriptions cannot be provided.

The resellers discount and ability to open support cases can be resolved by giving the provider the [RBAC](#) role "Support Request Contributor". This should be considered the least privilege that the provider would need.

In order to sell Reserved Instances or Savings Plans the provider would need the RBAC role "Owner". Some end users will set up a subscription just for reservations and give the provider the "Owner" role to that subscription.

It is important to note that these permissions interact with the Granular Delegated Administration Permissions. For example, without AOBO Owner and GDAP Directory Readers access to

reservations and subscription cannot be given. The Directory Readers Azure AD role allows the listing of user ids which may be given access.

4.6. Automated Access

Some TD SYNnex systems use service principals or service accounts to access the end user tenants.

4.6.1. Ordering/Provisioning

The eCommerce portals use service accounts called `orders@<domain>` or `StreamOneAdminService@<domain>` when ordering and provisioning services. Some examples include:

- Adding/changing/removing Modern Workplace (M365) licenses;
- Creating/changing/canceling Azure subscriptions;
- Adding/removing users and permissions via Lightweight User Management; and,
- Assigning licenses to users.

4.6.2. Partner Center Proxy Service

The TD SYNnex Partner Center Proxy Service allows resellers and end users to securely access Partner Center services via API. The service intercepts API requests to TD SYNnex Partner Centers and verifies that the request is permitted for a specific end user tenant.

The Partner Center Proxy Services uses a services account called `StreamOnePCProxy@<domain>` to login.

4.6.3. Security / GDAP

The Vertex system uses a service principal called `StreamOneAdminService@<domain>` for security related services and uses an enterprise application called TD SYNnex StreamOne Integration for subscription provisioning. Some examples include:

- Provisioning and changing GDAP relationships; and,
- Automated fraud detection.

The *TD SYNnex StreamOne Integration* service principals have the following Application IDs:

Country	Application ID
United States	b1e905bb-9f3c-4c24-b719-d20dcb725847
Canada	1ab66582-f65f-4997-ae7b-70caf8defa06
Mexico	32692590-c655-4789-8c3e-519ff25322cb

The access and permissions these service principals use is governed by the permission given to TD SYNnex via GDAP and AOBO. They do not have capabilities beyond those authorized by the end user customer.

All access from these accounts is logged in the tenant sign-in and audit logs.

4.6.4. Microsoft Enterprise Applications

When GDAP is provisioned, Microsoft creates two [service principals](#) in the end user Azure Entra ID. They will appear under enterprise applications.

They are:

Name	Application ID
Partner customer delegated administration	2832473f-ec63-45fb-976f-5d45a7d4bb91
Partner customer delegated admin offline processor	a3475900-ccec-4a69-98f5-a65cd5dc5306

The Partner customer delegated administration service principal is created when the GDAP relationship is accepted by the end user customer. It sets the cross-tenant access policy and manages permissions and roles.

The Partner customer delegated admin offline processor is required as long as the GDAP relationship exists and will be removed when the relationship ends. The end user should not attempt to remove this identity from within Azure Portal. They may terminate the GDAP relationship from the Microsoft Admin portal, if desired.

4.7. Local User Accounts

Local user accounts are not supported. Microsoft restricts Local User Accounts in a tenant from opening support cases. Support cases must be opened via the delegated admin staff account which has been linked to our support agreement with Microsoft.

End users who are unable to support the technologies previously listed will need to remove all access from TD SYNEX and provide it as required. This may delay the implementation of new services and support.

4.8. Conditional Access

[Conditional Access](#) is an intelligent security policy engine that allows end users to define specific conditions for how users authenticate and gain access to applications and data.

When conditional access is enabled in an end user tenant it can block access from users attempting to access the tenant via Delegated Administration Permissions (DAP/GDAP/AOBO).

Blocking access will prevent TD SYNEX from supporting the customer. Blocked capabilities include assigning permissions, opening support cases, adding reservations and many other activities. In some cases, blocking TD SYNEX access may affect reseller discounting.

Microsoft has provided a system to exclude TD SYNEX technicians from some policies. It is not often that TD SYNEX must be excluded from all policies.

Some policies that can cause issues for supporting end user customers if not excluded include:

1. Terms of Use Acceptance

Since reseller/provide users are not local to the Azure AD, they are not able to accept Terms of Use and there is no way for the local Azure AD to log the acceptance.

2. Third-Party MFA Solutions

TD SYNEX only uses Microsoft Authenticator. Requiring a third-party solution would block TD SYNEX technicians since they would not be able to authenticate. TD SYNEX is not able to support third-party solutions.

3. IP Restrictions

TD SYNEX is not able to provide the IP addresses for all of our offices or the constantly changing addresses of our remote workers.

4. Geo Restrictions

TD SYNEX is a global company with personnel in many countries around the world. Our ecommerce systems (which need access end user tenants) and support/operations/sales staff may work from other countries and remotely.

The TD SYNEX engineering team will work with the end user staff to determine which policies will require an exclusion.

4.9. Logging

As with any user, when a reseller/provider technician accesses the end user's tenant it is logged in the end user's Azure AD [Sign-in log](#).

It will log as a generic technician user similar to the following. TD SYNEX has a number of Partner Center environments so the username may be different. See Appendix B for a list of usernames.

Date	Request ID	User	Application	Status	IP address	Location
4/24/2023, 4:58:06 PM	7ec9536e-1a12-4eef-8...	SYNEX365 technician	Azure Portal	Success	165.225.9.XX	Herndon, Virginia, US
4/24/2023, 4:50:31 PM	e8dac07d-2b1e-47ff-9...	SYNEX365 technician	Azure Portal	Success	165.225.9.XX	Herndon, Virginia, US
4/24/2023, 4:33:38 PM	17d6753f-fc4a-47d6-9...	SYNEX365 technician	Azure Portal	Success	165.225.37.X	Dallas, Texas, US

When drilling into the details, the user's object ID from the TD SYNEX management tenant will be displayed.

User	SYNEX365 technician
Username	user_11f2b60ec381...b99f2eb@synne...om
User ID	11f2b60e-...27bb99f2eb
Sign-in identifier	
User type	Unknown
Cross tenant access type	Service provider

TD SYNEX can translate the user id to a person as needed. Each TD SYNEX user has a unique user id connected to their login. The actual user id and name is hidden from the end user for security reasons.

Should a TD SYNEX technician make changes to a subscription, the changes are logged to the [Activity Log](#) in the same manner.

Finally, provider credentials are a special "Service Provider" type and can be monitored via SIEM solutions as well.

4.10. Lockbox Support

TD SYNEX's access comes through our Microsoft Partner Center management tenant over HTTPS. TD SYNEX cannot give access to our management tenant to the end user and cannot provide resellers or end users with visibility into it.

4.11. Requesting Partner Center Access

TD SYNEX has a defined process for requesting access to our Partner Center environments. Only individuals with a need to access a specific environment are granted access.

- A user who believes they need access to an environment submits a support ticket requesting specific permissions;
- The request is approved by their immediate supervisor;
- Some permissions require additional approval from their Director and/or VP;
- Approved requests are sent to engineering management for final approval. If the requested permissions do not make sense for the individual's role the request is rejected or more information is requested.
- After approval by engineering, the request is forwarded to the IAM team in TD SYNEX Security for provisioning. The IAM team provides credentials to the user.

The environments are tied to our HR system. When a user changes departments or is terminated, the login is removed.

4.12. Partner Center Security

TD SYNEX follows industry best practices to help keep our Partner Center access secure. Some of the tools and processes used include:

- A defined process to request and manage access per Section 4.11 above.
- Monitoring by TD SYNEX's cybersecurity center using multiple SIEM solutions.
- Extensive logging of all activity.
- Regular review of users and permissions to ensure least privilege.
- Enforcing identity isolation to limit lateral movement should a break occur.
- Blocking and removal of unnecessary features in Partner Center tenants.
- Implementation of Conditional Access and Risky User detection in tenants.
- Require all users to use multifactor authentication (MFA).

4.13. TD SYNEX Security and Privacy

Greater and ongoing security and privacy safeguards are among our top priorities. TD SYNEX is compliant with Microsoft's mandatory security requirements for the CSP program as defined at: <https://learn.microsoft.com/en-us/partner-center/partner-security-requirements#mandatory-security-requirements>

Only approved TD SYNEX personnel have access to our Microsoft Partner Centers. Approved user accounts have a unique user principal name attribute value associated with their account. TD SYNEX does not use shared user accounts, and each user principal name is personally identifiable. Users are granted the least privileged role and permission as deemed appropriate to their support role responsibilities.

TD SYNEX respects and protects the rights of those whose personal information we process, and TD SYNEX companies comply with relevant privacy regulations. Our compliance with applicable regulatory requirements relative to the processing of personal information is protected by our internal privacy and information security control frameworks. As part of this framework, we provide training to our co-workers and commit our co-workers and partners to protect the confidentiality of the information

that we process. In addition, we also obtain contractual commitments from our third-party suppliers to provide an equivalent level of protection for the personal information that they process on our behalf. The cornerstones of our policy framework relative to the protection of personal information consist of:

- [TD SYNEX Global Code of Conduct](#);
- [Privacy policy](#);
- Information security policies; and,
- Physical security policies.

TD SYNEX encourages its co-workers and the individuals whose data is processed by us, to [report any noncompliance](#) relative to the processing of personal information. Our policy framework ensures that potential non-compliant data processing activities are openly addressed and obliges management and co-workers to remediate non-compliant situations.

TD SYNEX maintains a Cybersecurity Customer Assurance team that provides support to business teams through the partnership with Customers, Resellers and Trade Vendors. It ensures customer cybersecurity requirements are managed and the customer satisfaction is met through its supplier risk management (cybersecurity audit/assessment) program. The team may be engaged through the reseller's TD SYNEX Account Manager.

5. Definitions

Term	Definition
AdminAgents	An Azure AD security group created by Microsoft in the reseller and provider tenants to facilitate AOBO. This group is created by Microsoft and cannot be created manually.
AOBO	Administration on Behalf Of (AOBO) allows reseller and/or provider users who are members of the AdminAgents group to access and manage Azure subscriptions.
Azure AD	Azure Active Directory (AAD or Azure AD) is the cloud-based identity and access management system used with Microsoft Azure. AAD may be integrated with on-premises Active Directory in a hybrid model. See: What is Azure Active Directory?
Azure Entra ID	Azure Entra ID is the new name for Azure AD.
Conditional Access	An intelligent security policy engine that allows end users to define specific conditions for how users authenticate and gain access to applications and data. Conditional Access requires an Azure AD P1 or P2 license. See: Conditional Access
CSP	The Microsoft Cloud Solution Provider (CSP) program allows partners to create and deliver differentiated offers to customers, selling the Microsoft cloud portfolio and third-party solutions from the Microsoft commercial marketplace alongside their own value-added solutions and services.
DAP	Delegated Administration Permissions (DAP) provides Azure AD Global Administrator permissions to specified users from the reseller and/or provider. In 2023, DAP was deprecated in favor of GDAP.

TD SYNEX Access to End User Tenants

Type:	7. Reference	Version:	6.2
Status:	Final	Effective:	5/8/2026

Direct Provider	See Provider.
Directory Readers	An Azure AD role that can read basic directory information. Commonly used to grant directory read access to applications and guests. See: Directory Readers
End User	The organization that uses or consumes the Azure resources provided by the provider/reseller to satisfy a business requirement. Usually the customer of a reseller.
Foreign Principal	An Azure AD user or group that has access to another (foreign) Azure AD. With AOBO, the reseller and/or provider AdminAgents group will appear as a foreign principal in the end user subscription RBAC.
GDAP	Granular Delegated Administration Permissions (GDAP) provides Azure AD permissions to specified users from the reseller and/or provider. Any Azure AD role may be included in the GDAP permissions; therefore, a more limited set of permissions than available under DAP is available. See: Granular delegated admin privileges (GDAP) introduction
Global Administrator	An Azure AD role that can manage all aspects of Azure AD and Microsoft services that use Azure AD identities. The global administrator role has no restrictions. See: Azure AD built-in roles
Indirect Provider	See Provider.
Indirect Reseller	See Reseller.
Owner	An Azure RBAC role that grants full access to manage all resources, including the ability to assign roles in Azure RBAC. See: Owner
Partner Center	Partner Center (PC or PAC) is an application Microsoft supplies to resellers and providers to manage end user customers. See: What is Partner Center?
PEC	Partner Earned Credit (PEC) provides a discount to the reseller for supporting an end user environment. In the CSP program, if access is completely removed from an Azure subscription the discount is lost and the cost of the subscription increases to MSRP+. See: Partner Earned Credit
Provider	The company that purchases Azure subscriptions from and receives an invoice directly from Microsoft. The Provider may be either Direct (acting as a provider and reseller) or Indirect (acting as on a provider). TD SYNEX is an Indirect provider. See: Cloud Solution Provider program overview
RBAC	Roles Based Access Control (RBAC) provides permissions to Azure subscriptions. RBAC roles exist separately from Azure AD roles;

	however, the users associated with RBAC roles must exist in the Azure AD. See: What is Azure role-based access control?
Reseller	The company that purchases Azure subscriptions from TD SYNEX and sells the subscription to the end user.
Service Principal	An Azure service principal is a security identity that represents an application or service in the Azure Entra ID (Azure AD). It is similar to a user account but is used for non-human authentication and authorization processes. Service principals enable applications and services to authenticate and access Azure resources without the need for human involvement. They are commonly used to automate tasks, enable programmatic access, and manage permissions within Azure.
Service Support Administrator	An Azure AD role that can read service health information and manage support tickets for Microsoft Modern Workplace. See: Service Support Administrator
Support Request Contributor	An Azure RBAC role that allows a provider technician to create and manage support requests. In the CSP program this role does not work for resellers and end users. See: Support Request Contributor
TD SYNEX	TD SYNEX (TD SYNEX) is a multinational IT distribution business and a Microsoft Indirect Provider. See: https://www.TDSYNEXynnex.com/na/us/
Tenant	An instance of Azure Active Directory used for identity and access management with Microsoft cloud services. See: What is Azure Active Directory?

6.2	5/8/2026	Updated Default GDAP and added auto extend	David Bloom

9. Appendix A – GDAP Role Descriptions

TD SYNnex requests roles to support the customer. Detailed information about each role is available at: [Microsoft Entra built-in roles - Microsoft Entra ID | Microsoft Learn](#)

9.1.1. Service Support Administrator

Access Request:	Limited and Recommended
Privileged?:	No
Documentation:	Service Support Administrator
Description:	Allows for the creation and management of support requests for Microsoft 365 services

9.1.2. Global Reader

Access Request:	Limited and Recommended
Privileged?:	Yes
Documentation:	Global Reader
Description:	Can read settings and administrative information across Microsoft 365 services but cannot make changes.

9.1.3. Cloud Application Administrator

Access Request:	Limited and Recommended
Privileged?:	Yes
Documentation:	Cloud Application Administrator
Description:	Allows the ability to create and manage all aspects of enterprise applications and application registrations. It is used by the TD SYNnex eCommerce platform to manage our enterprise application in the end user tenant.

9.1.4. Help Desk Administrator

Access Request:	Recommended
Privileged?:	Yes
Documentation:	Help Desk Administrator
Description:	Can change passwords, invalidate refresh tokens, create and manage support requests for Microsoft 365 services, and monitor service health.

9.1.5. Privileged Authentication Administrator

Access Request:	Recommended
Privileged?:	Yes
Documentation:	Privileged Authentication Administrator
Description:	Can set or reset authentication methods for all users, delete or restore any user, force users to re-register MFA and update sensitive properties for all users.

9.1.6. Billing Administrator

Access Request:	Recommended
Privileged?:	No
Documentation:	Billing Administrator
Description:	Can make purchases and manage subscriptions.

9.1.7. License Administrator

Access Request:	Recommended
Privileged?:	No
Documentation:	License Administrator
Description:	Can read, add, remove, and update license assignments on users, groups, and manage the usage location on users.

9.1.8. User Administrator

Access Request:	Recommended
Privileged?:	Yes
Documentation:	User Administrator
Description:	Can create users, update most user properties, disable/delete some users, reset passwords, and assign/read licenses for all users. Can not create or reset passwords for privileged users.

9.1.9. Intune Administrator

Access Request:	Recommended
Privileged?:	Yes
Documentation:	Intune Administrator
Description:	Users with this role have global permissions within Microsoft Intune Online, when the service is present. Additionally, this role contains the ability to manage users and devices in order to associate policy, as well as create and manage groups.

9.1.10. Security Administrator

Access Request:	Recommended
Privileged?:	Yes
Documentation:	Security Administrator
Description:	Users with this role have permissions to manage security-related features in the Microsoft 365 Defender portal, Microsoft Entra ID Protection, Microsoft Entra Authentication, Azure Information Protection, and Microsoft Purview compliance portal.

9.1.11. Password Administrator

Access Request:	Recommended
Privileged?:	Yes
Documentation:	Password Administrator ,
Description:	Provides a limited ability to manage passwords for non-admin users.

9.1.12. Directory Reader

Access Request:	Recommended
Privileged?:	No
Documentation:	Directory Reader
Description:	Can read basic directory information .

10. Appendix B - Default GDAP

When a CSP Indirect Provider (distributor) creates a new Microsoft tenant for an end user, the Indirect Provider can request default GDAP permissions. TD SYNnex requests default GDAP permissions.

The default permissions allow TD SYNnex to support the end user customer in setting up the new tenant. The customer may terminate the permissions if desired.

The permissions included in the default GDAP cannot be edited.

The Default GDAP permissions are added to the TD SYNnex AdminAgents security group since Microsoft's automation is unaware of the TD SYNnex created security groups. This allows any user who is a member of the AdminAgents security group to access the permissions granted by Default GDAP. TD SYNnex recommends terminating Default GDAP after establishing another GDAP relationship with TD SYNnex.

Default GDAP Permission	TD SYNnex GDAP Recommended
Application Administrator	
	Billing Administrator
Cloud Application Administrator	Cloud Application Administrator
Directory Reader	Directory Reader
Directory Writer	
Global Reader	Global Reader
Helpdesk Administrator	Helpdesk Administrator
	Intune Administrator
License Administrator	License Administrator
	Password Administrator
Privileged Authentication Administrator	Privileged Authentication Administrator
Privileged Role Administrator	
	Security Administrator
Service Support Administrator	Service Support Administrator
User Administrator	User Administrator

Note: Although Default GDAP and TD SYNnex GDAP Recommended are not related, they are included in the above table for comparison.

11. Appendix C – Log Files

Microsoft hides the username of TD SYNEX engineers in log files. The usernames in log files will be the same regardless of which engineer logs in.

Usernames appearing in log files:

PAC	Domain	Username
Stellr US	synnex365.com	TD SYNEX US (Stellr) technician
SCM US	tdmsft.com	TD SYNEX US (SCM) technician
SIE US	TechDataTSAVT.onmicrosoft.com	TD SYNEX US (ION) technician
Stellr US (Alt)	snx365.onmicrosoft.com	TD SYNEX US (PSfP) technician
TD TS	TechDataTS.onmicrosoft.com	TD SYNEX US (TD TS) technician
DLT 1	DLTMSFT1.onmicrosoft.com	DLT US (Msft1) technician
DLT 2	DLTMSFT2.onmicrosoft.com	DLT US (Msft2) technician
Synnex CA	synnexca.onmicrosoft.com	TD SYNEX Canada (L-SNX) technician
TechData CA	Techdatacanada.com	TD SYNEX Canada (L-TD) technician
AVT CA	TechDataS1ECA.onmicrosoft.com	TD SYNEX Canada (AVT) technician

12. Appendix D – TD SYNnex Foreign Principals

In Azure subscriptions under Access Control (IAM) the TD SYNnex foreign principal will show up as one of the following:

PAC	Name
Stellr US	Foreign Principal for 'SYNNEX' in Role 'TenantAdmins' (<i>endUserTenant</i>)
SCM US	Foreign Principal for 'Tech Data' in Role 'TenantAdmins' (<i>endUserTenant</i>)
SIE US	Foreign Principal for 'Tech Data Corp (ION)' in Role 'TenantAdmins' (<i>endUserTenant</i>)
Synnex CA	Foreign Principal for 'Synnex Canada Limited' in Role 'TenantAdmins' (<i>endUserTenant</i>)
TechData CA	Foreign Principal for 'Tech Data Canada Corporation' in Role 'TenantAdmins' (<i>endUserTenant</i>)
AVT CA
