

Tech Note – Enable a Scheduled Analytic in Sentinel

			
Type:	3. Procedure	Version:	1.0
Status:	Final	Effective:	6/6/2023

1. Purpose

Explain the process of enabling a schedule analytic in Microsoft Sentinel

2. Table of Contents

5.	Document Approval.....	3
6.	Document Revision History	4

3. Procedure

1. Sign into the [Azure portal](#) using your Azure account credentials.
2. In the Azure portal, navigate to the Azure Sentinel workspace where you want to enable the scheduled analytic rule.
3. In the left-hand menu, click on "Analytics" under the "Configuration" section.
4. Click on "Rule templates" at the top of the analytics list.

5. On the Analytics page, you will see a list of existing analytic rules. Locate the rule that you want to enable with a schedule.
6. Click on the rule to open its configuration blade on the right.
7. In the rule configuration blade, click on the "Create Rule" button at the bottom.

Tech Note – Enable a Scheduled Analytic in Sentinel

			
Type:	3. Procedure	Version:	1.0
Status:	Final	Effective:	6/6/2023

8. Under “General” tab at the top review:

Note: all fields will be filled by default but can be customized.

- “Name” (Only required field in this tab)
- “Description”
- “Tactics and Techniques”
- “Severity”
- “Status” (Ensure this is switched to “Enabled”)

9. Click “Next: Set rule logic” at the bottom in the blue button.

10. This tab is where you can modify the KQL query logic, map entities, query scheduling, and alert threshold.

a. Review KQL logic and run a simulation on current data. (Not every analytic has this available.)

- To run a simulation, click on the “Test with current data” in the blade on the right. *Note: Running a simulation is NOT required but may be helpful if modifications are made to the KQL logic.*

- b. Below the KQL logic, select any additional entities (Accounts, IP addresses, etc.) you wish to map. *Note: It is best practice to map entities as this will aid with investigations and will likely be mapped by default.*
 - c. Under “Query scheduling” select how often the analytic will run and how far back it should look.
 - d. Under “Alert threshold” set “Is greater than” to zero. *Note: it is best practice to leave this at zero unless you have a significant need to change it.*
 - e. You may leave all other selections at their default state. Please see documentation for details on options.
11. Click on the “Next: Incident settings” button at the bottom.

After completing these steps, the analytic rule will be enabled with the specified schedule. It will run automatically based on the configured frequency, and you will start receiving the results or alerts generated by the rule according to the defined schedule.

12. Ensure that “Create incidents from alerts triggered by this analytic rule” is set to “Enabled”
13. Leave all other options in default.
14. Click on the “Next: Automated response” button at the bottom.
15. You may add playbooks or automations to this analytic. This is optional.
16. Click “Next: Review”
17. Review all sections on this page. Sentinel will run an automatic validation check to ensure you have made all required selections. The create button will be enabled after this check.
18. Click “Create”
19. Sentinel will take you back to the “Active Rules” tab on the Analytics page. Search for the newly created analytic and verify that the status is “Enabled”.
