3.1. Announcement

Microsoft announced in [Azure updates](#) and via emails to customers using virtual machines with default outbound access, that they will be retiring default outbound access on September 30, 2025.

Default outbound access for VMs in Azure will be retired—
transition existing VMs to a new method of internet access

You're receiving this notification because you are associated with one or more Azure subscriptions that use Virtual Machines (VMs) in Azure with default outbound access.

In Azure, VMs that are created in a virtual network without a defined explicit outbound method are assigned a default public IP address that enables internet connectivity. **On 30 September 2025, default outbound access connectivity for VMs in Azure will be retired.**

After this date, all new VMs that require internet access will need to use an explicit method of outbound connectivity such as Azure NAT Gateway, Azure Load Balancer outbound rules, or a directly attached Azure public IP address. Existing VMs that use default outbound access will still have internet connectivity, however, explicit outbound methods improve reliability.

Recommended action

To ensure more reliable internet connections, transition any existing VMs that rely on default outbound access to use an explicit method of connectivity. Please see [here](#) for more information.

If you deploy VMs on Azure Cloud Services (extended support), this retirement won't affect you and you don't need to take any action.

In order to determine which virtual machines for your subscription are in scope, please utilize Azure Advisor and look for the "Add explicit outbound method to disable default outbound" recommendation in the "Operational excellence" section to show the specific virtual machine NICs using default outbound.

3.2. History

Prior to September 30, 2025, when a virtual machine was created without explicit outbound access defined, it was assigned a default outbound IP address. This IP address enabled them to connect to resources on the Internet.

This default access creates security and scalability concerns which will be addressed by the customer explicitly creating outbound access.

3.3. Recommendation

All newly created virtual machines (created after Sept 30, 2025) that need to access the Internet will require an explicit outbound connectivity method such as Azure NAT Gateway, Azure Load Balancer outbound rules, or a directly attached Azure public IP address

See: [Default outbound access in Azure - Azure Virtual Network | Microsoft Learn](#)

Although not affected by the retirement, Microsoft recommends transitioning all existing virtual machines using default outbound access to an explicit method.

3.4. Transition Professional Services

Should your customer require support with creating new virtual machines or transitioning existing virtual machines to using explicit methods, the TD SYNEX ServiceSolv team can provide resources to assist.

Contact your TD SYNEX account manager for assistance with engaging the ServiceSolv team.
